

视图与视图控制器

一、MVC

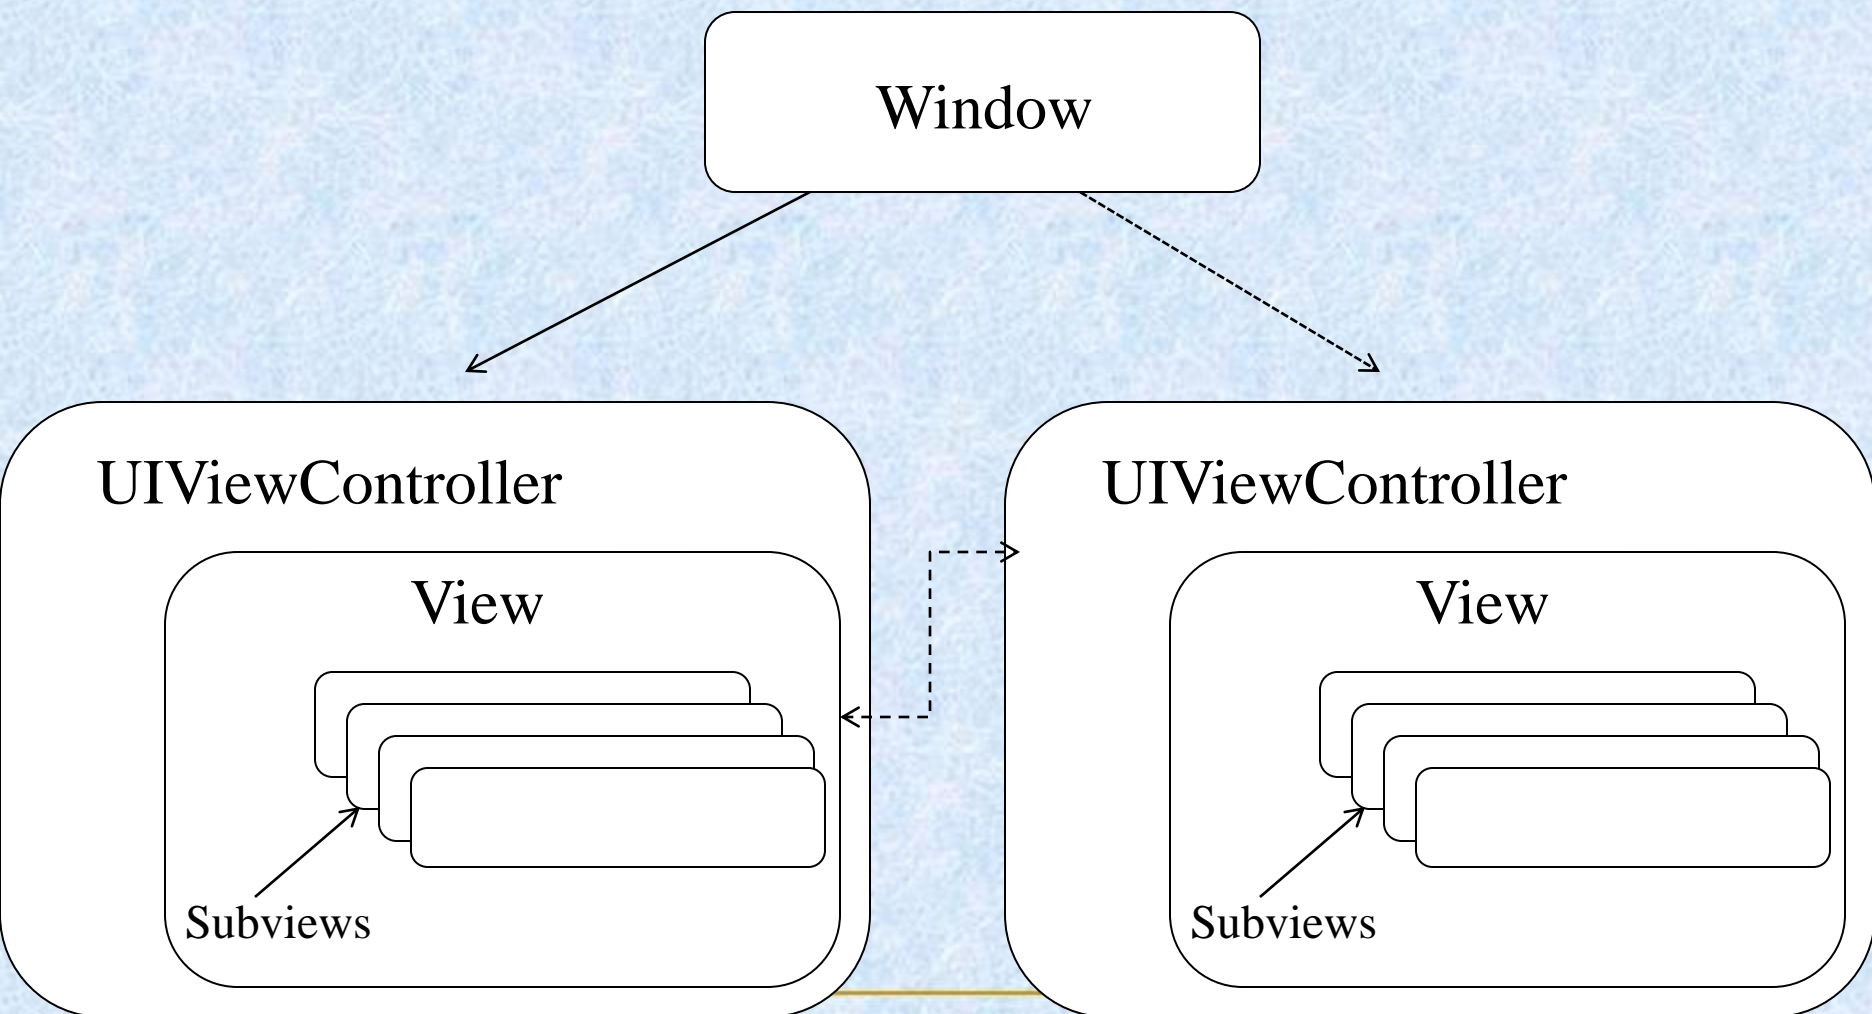

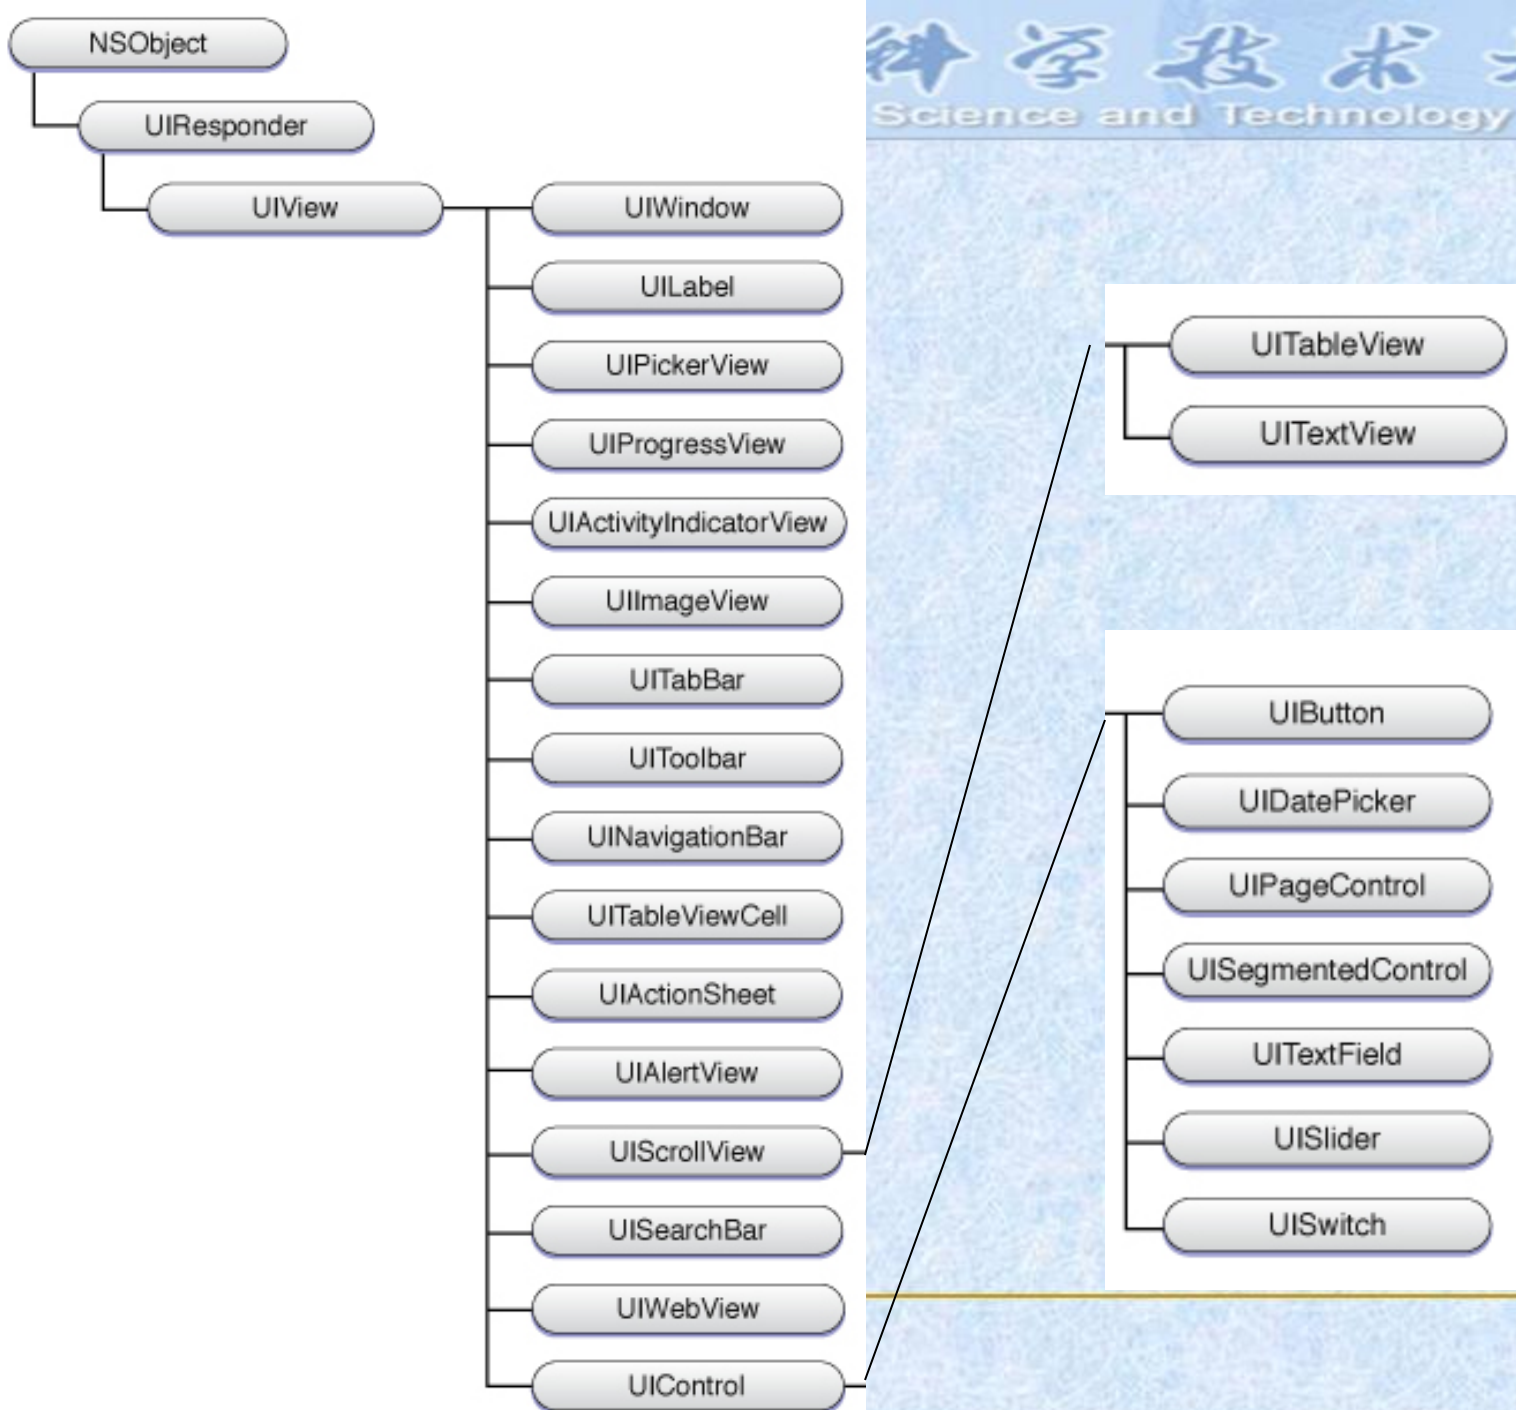

多个MVC协同工作

二、窗口、视图与视图控制器的关系

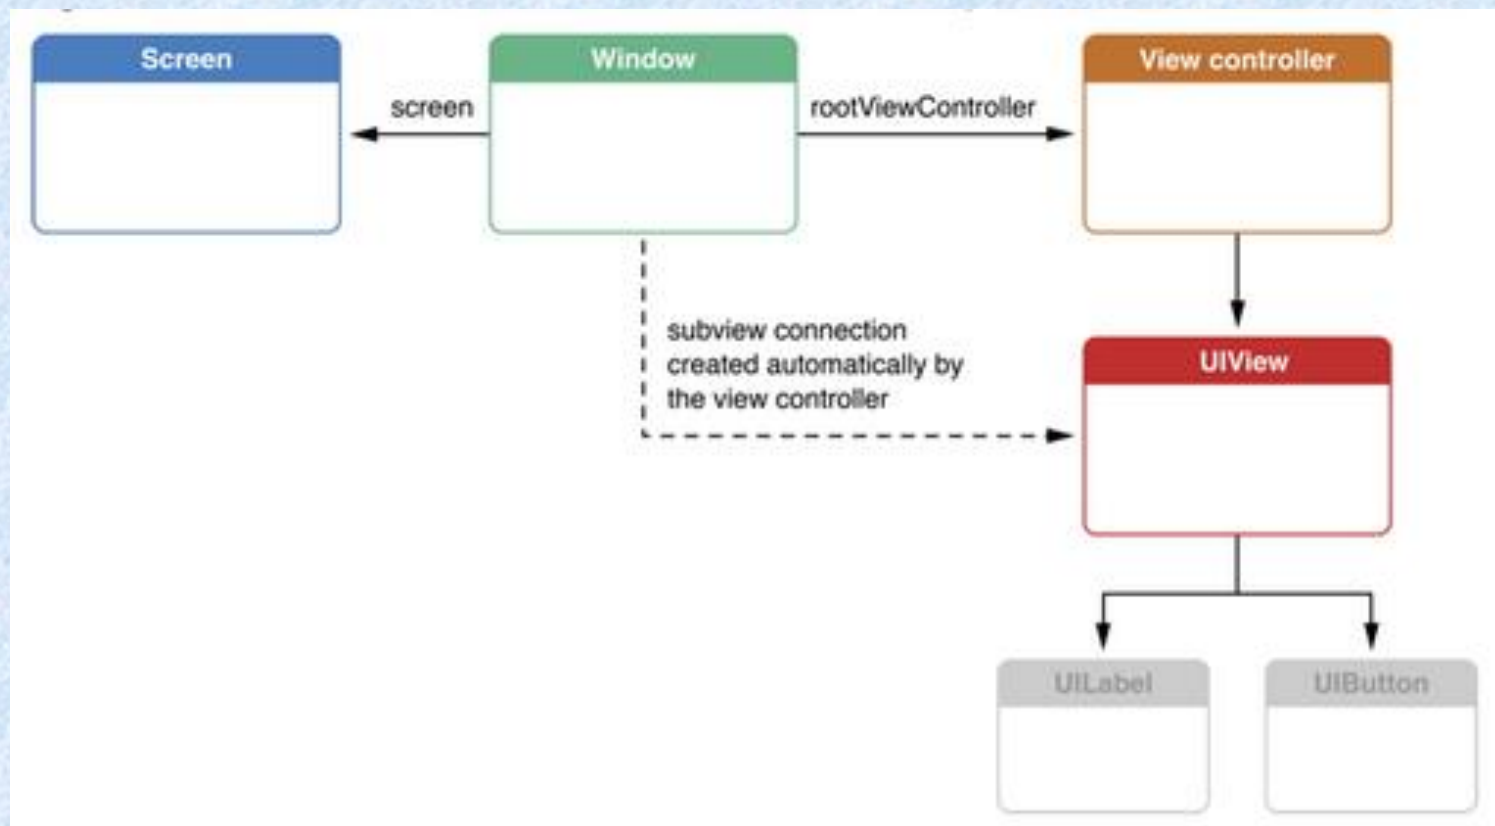

三、窗口

- 在IOS中窗口是一种特殊的视图，通常在一个app中只会有一个窗口。

- IOS程序启动完毕后，创建的第一个视图控件就是窗口，接着创建控制器的视图，最后将控制器的视图添加到窗口上，于是控制器的视图就显示在屏幕上了

先创建UIwindow,再创建控制器，创建控制器的view，然后将控制器的view添加到UIWindow上

● 窗口对应的类是UIWindow。默认情况下其大小与屏幕一致，请勿修改。可以通过下面代码获得窗口对象

```
UIWindow *win=[[UIWindow alloc] initWithFrame:[[UIScreen mainScreen] bounds]];
```

● 当在故事板（storyboard）中使用IB创建UI时，会自动帮助创建UIWindow.

注意： Mac中编程可能会用到多个窗口，所有需要用UIWindow,但在IOS中只有一个窗口，所以基本不用UIWindow,只是使用UIViews

四、视图

1、什么是视图？

- 视图表示屏幕上的一块矩形区域，它在App中占有绝对重要的地位，因为IOS中几乎所有可视化控件都是视图或其子类。

- 和窗口不同，允许在一个窗口中包含多个视图，并且视图的尺寸是任意尺寸。并且视图可以进行嵌套和响应事件。

- 视图对应的类是UIView及其子类:

创建视图可以有两种方法:

- 1、 在故事板 (storyboard) 中利用IB创建。
 - 2、 代码的方法。
-

视图对象是应用程序和用户交互的主要途径，其主要作用有

- 描画和动画

- 视图负责对其所属的矩形区域进行描画。

- 某些视图属性变量可以以动画的形式过渡到新的值。

- 布局和子视图管理

- 视图管理着一个子视图列表。

- 视图定义了自身相对于其父视图的尺寸调整行为。

- 必要时，视图可以通过代码调整其子视图的尺寸和位置。

- 视图可以将其坐标系统下的点转换为其它视图或窗口坐标系统下的点。

- 事件处理

- 视图可以接收触摸事件。

- 视图是响应者链的参与者。

2、视图坐标系

- IOS中视图的坐标系是以左上为原点的。这点和MAC OS中坐标系不同（左下）。
- 同时要注意的是如果我们直接使用框架(eg:Quartz 2D)进行绘图，那么原点默认为左下。
- 要注意，视图的坐标系中的每个点并不指定是像素，一个点可能包括多个像素。可以使用下面视图的属性来得到每点像素数量。

```
@property(nonatomic) CGFloat contentScaleFactor
```

3、关于视图坐标的数据类型

●CGFloat

为了兼容32位和64位系统

●CGPoint

A structure that contains a point in a two-dimensional coordinate system.

Declaration

OBJECTIVE-C

```
struct CGPoint { CGFloat x; CGFloat y; }; typedef struct CGPoint CGPoint;
```

Fields

x	The x-coordinate of the point.
y	The y-coordinate of the point.

●CGRect

A structure that contains the location and dimensions of a rectangle.

Declaration

OBJECTIVE-C

```
struct CGRect { CGPoint origin; CGSize size; }; typedef struct CGRect CGRect;
```

Fields

<i>origin</i>	A point that specifies the coordinates of the rectangle's origin.
<i>size</i>	A size that specifies the height and width of the rectangle.

●CGSize

A structure that contains width and height values.

Declaration

OBJECTIVE-C

```
struct CGSize { CGFloat width; CGFloat height; }; typedef struct CGSize CGSize;
```

Fields

<i>width</i>	A width value.
<i>height</i>	A height value.

几个例子:

• CGPoint

C struct with two CGFloats in it: **x** and **y**.

```
CGPoint p = CGPointMake(34.5, 22.0);  
p.x += 20; // move right by 20 points
```

• CGSize

C struct with two CGFloats in it: **width** and **height**.

```
CGSize s = CGSizeMake(100.0, 200.0);  
s.height += 50; // make the size 50 points taller
```

• CGRect

C struct with a CGPoint **origin** and a CGSize **size**.

```
CGRect aRect = CGRectMake(45.0, 75.5, 300, 500);  
aRect.size.height += 45; // make the rectangle 45 points taller  
aRect.origin.x += 30; // move the rectangle to the right 30 points
```

4、边框、边界和中心

视图UIView对象通过frame、bounds、和center属性声明来跟踪自己的大小和位置。

● 边框frame

frame

The frame rectangle, which describes the view's location and size in its superview's coordinate system.

Declaration

OBJECTIVE-C

```
@property(n nonatomic) CGRect frame
```

● 边界bounds

bounds属性也包含一个矩形，边即边界矩形，负责定义视图相对于本地坐标系统的位置和大小。边界矩形的原点通常被设置为 (0, 0)。也可以改动原点位置。

bounds

The bounds rectangle, which describes the view's location and size in its own coordinate system.

Declaration

OBJECTIVE-C

```
@property(nonatomic) CGRect bounds
```

● 中心center

center属性包含边框矩形的中心点，用CGPoint表示矩形中心点在其父视图中的位置。中心点代表视图的中心。改变中心点一直是移动视图位置的最好方法。

center

The center of the frame.

Declaration

OBJECTIVE-C

```
@property(n nonatomic) CGPoint center
```

Because views can be rotated
(and scaled and translated too).

View B's **bounds** = $((0,0), (200,250))$

View B's **frame** = $((140,65), (320,320))$

View B's **center** = $(300,225)$

View B's middle in its own coordinate space is
 $(\text{bound.size.width}/2 + \text{bounds.origin.x},$
 $\text{bounds.size.height}/2 + \text{bounds.origin.y})$
which is $(100,125)$ in this case.

Views are rarely rotated, but don't
misuse **frame** or **center** by assuming that.

frame、bounds和center三个属性是相互关联、相互影响的，
其中一个属性发生变化，其他属性也会跟着变化。

Superview

Frame rectangle at (5.0, 5.0), size (73.0, 98.0)

Bounds rectangle at (0.0, 0.0), size (73.0, 98.0)

Superview

Frame rectangle at (5.0, 5.0), size (73.0, 88.0)

Bounds rectangle at (8.0, 24.0), size (73.0, 88.0)

注意：缺省情况下，视图的边框并不会被父视图的边框裁剪。如果您希望让一个视图裁剪其子视图，需要将其`clipsToBounds`属性设置为YES。

5、内容模式和比例缩放

改变视图的边界或者将一个比例因子应用到视图的transform属性声明时，边框矩形会发生等量的变化。根据内容模式的不同，视图的内容也可能被缩放或重新定位，以反映上述的变化。

视图的contentMode属性决定了边界变化和缩放操作作用到视图上产生的效果。缺省情况下，这个属性的值被设置为UIViewContentModeScaleToFill，意味着视图内容总是被缩放，以适应新的边框尺寸。

Superview

View with transform set

Bounds rectangle at (0.0, 0.0), size (73.0, 98.0)

常用的几种模式

UIViewContentModeLeft

Nondistorting

UIViewContentModeScaleAspectFill

Nondistorting

UIViewContentModeScaleAspectFit

Nondistorting

UIViewContentModeScaleToFill

Distorting

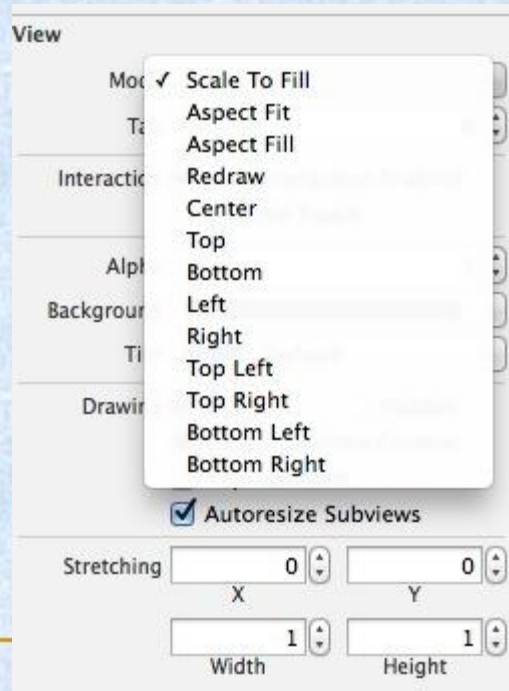

如何设置contentMode属性

方法一：代码方式。

```
self.view.contentMode=UIViewContentModeScaleAspectFit;
```

方法二：故事板 (Storyboard), 属性检测器。

视图的transform属性

transform

Specifies the transform applied to the receiver, relative to the center of its bounds.

Declaration

OBJECTIVE-C

```
@property(nonatomic) CGAffineTransform transform
```

仿射矩阵的数据结构

CGAffineTransform

A structure for holding an affine transformation matrix.

Declaration

OBJECTIVE-C

```
struct CGAffineTransform { CGFloat a; CGFloat b; CGFloat c; CGFloat d; CGFloat tx; CGFloat ty; }; typedef  
struct CGAffineTransform CGAffineTransform;
```

Fields

a	The entry at position [1,1] in the matrix.
b	The entry at position [1,2] in the matrix.
c	The entry at position [2,1] in the matrix.
d	The entry at position [2,2] in the matrix.
tx	The entry at position [3,1] in the matrix.
ty	The entry at position [3,2] in the matrix.

$$\begin{bmatrix} x' & y' & 1 \end{bmatrix} = \begin{bmatrix} x & y & 1 \end{bmatrix} \times \begin{bmatrix} a & b & 0 \\ c & d & 0 \\ t_x & t_y & 1 \end{bmatrix}$$

仿射变换

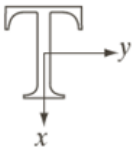

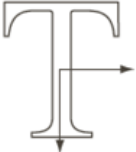

$$\begin{aligned} x' &= ax + cy + t_x \\ y' &= bx + dy + t_y \end{aligned}$$

$$\begin{bmatrix} a & b & 0 \\ c & d & 0 \\ t_x & t_y & 1 \end{bmatrix}$$

仿射矩阵

Transformation Name	Affine Matrix, T	Coordinate Equations	Example
Identity	$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$	$\begin{aligned} x &= v \\ y &= w \end{aligned}$	
Scaling	$\begin{bmatrix} c_x & 0 & 0 \\ 0 & c_y & 0 \\ 0 & 0 & 1 \end{bmatrix}$	$\begin{aligned} x &= c_x v \\ y &= c_y w \end{aligned}$	
Rotation	$\begin{bmatrix} \cos \theta & \sin \theta & 0 \\ -\sin \theta & \cos \theta & 0 \\ 0 & 0 & 1 \end{bmatrix}$	$\begin{aligned} x &= v \cos \theta - w \sin \theta \\ y &= v \sin \theta + w \cos \theta \end{aligned}$	
Translation	$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ t_x & t_y & 1 \end{bmatrix}$	$\begin{aligned} x &= v + t_x \\ y &= w + t_y \end{aligned}$	
Shear (vertical)	$\begin{bmatrix} 1 & 0 & 0 \\ s_v & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$	$\begin{aligned} x &= v + s_v w \\ y &= w \end{aligned}$	
Shear (horizontal)	$\begin{bmatrix} 1 & s_h & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$	$\begin{aligned} x &= v \\ y &= s_h v + w \end{aligned}$	

恒等变换

CGAffineTransformIdentity

The identity transform.

Declaration

OBJECTIVE-C

```
const CGAffineTransform CGAffineTransformIdentity;
```

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

执行恒等变换。如果改变过一个视图的transform属性后又要恢复默认状态进行重置可以使用：

`view.transform = CGAffineTransformIdentity`

变换方式

1、常用方法是利用Core Graphics框架(quartz 2D)中的变换函数。

eg:

```
CGAffineTransform CGAffineTransformMake ( CGAffineTransform a, CGAffineTransform b, CGAffineTransform c, CGAffineTransform d, CGAffineTransform tx, CGAffineTransform ty );  
CGAffineTransform CGAffineTransformMakeRotation ( CGAffineTransform angle );  
CGAffineTransform CGAffineTransformMakeScale ( CGAffineTransform sx, CGAffineTransform sy );  
CGAffineTransform CGAffineTransformMakeTranslation ( CGAffineTransform tx, CGAffineTransform ty );  
CGAffineTransform CGAffineTransformTranslate ( CGAffineTransform t, CGAffineTransform tx, CGAffineTransform ty );  
CGAffineTransform CGAffineTransformScale ( CGAffineTransform t, CGAffineTransform sx, CGAffineTransform sy );  
CGAffineTransform CGAffineTransformRotate ( CGAffineTransform t, CGAffineTransform angle );
```

2、直接计算并设置变换矩阵。

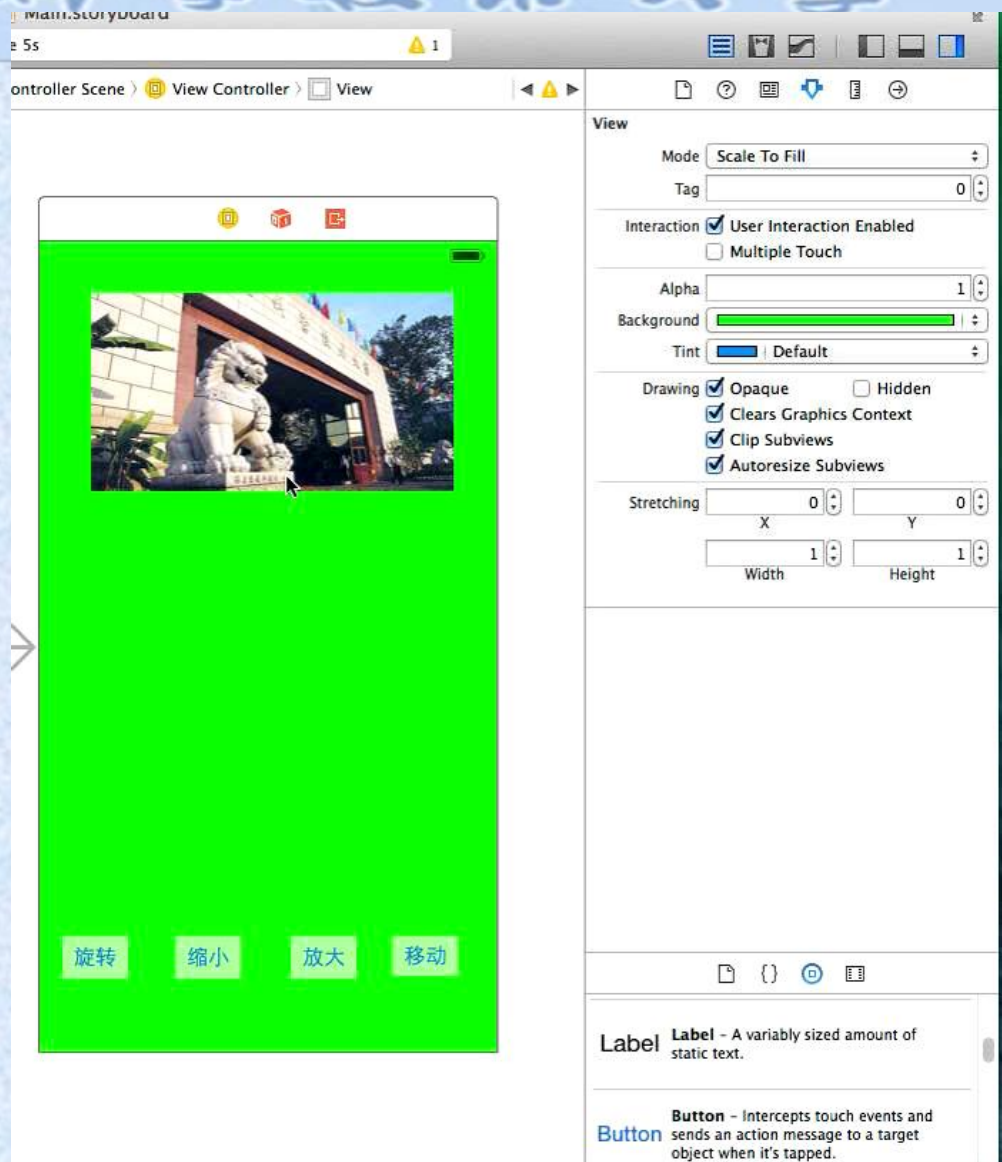

示例

```
- (IBAction)changePosition:(UIButton *)sender {
    if (sender.tag==1) {
        self.imgview.transform=CGAffineTransformRotate(self.
            imgview.transform, 0.1);
    }

    if (sender.tag==2) {
        self.imgview.transform=CGAffineTransformScale(self.imgview
            .transform,0.5, 0.5);
    }

    if (sender.tag==3) {
        self.imgview.transform=CGAffineTransformScale(self.imgview
            .transform,1.5, 1.5);
    }

    if (sender.tag==4) {
        self.imgview.transform=CGAffineTransformTranslate(self.
            imgview.transform, 0, 10);
    }
}
```

6、视图间的层级关系

一个视图拥有一个父视图，也可能包含多个子视图。

- 获取父视图可通过属性superview

(UIView *) superview

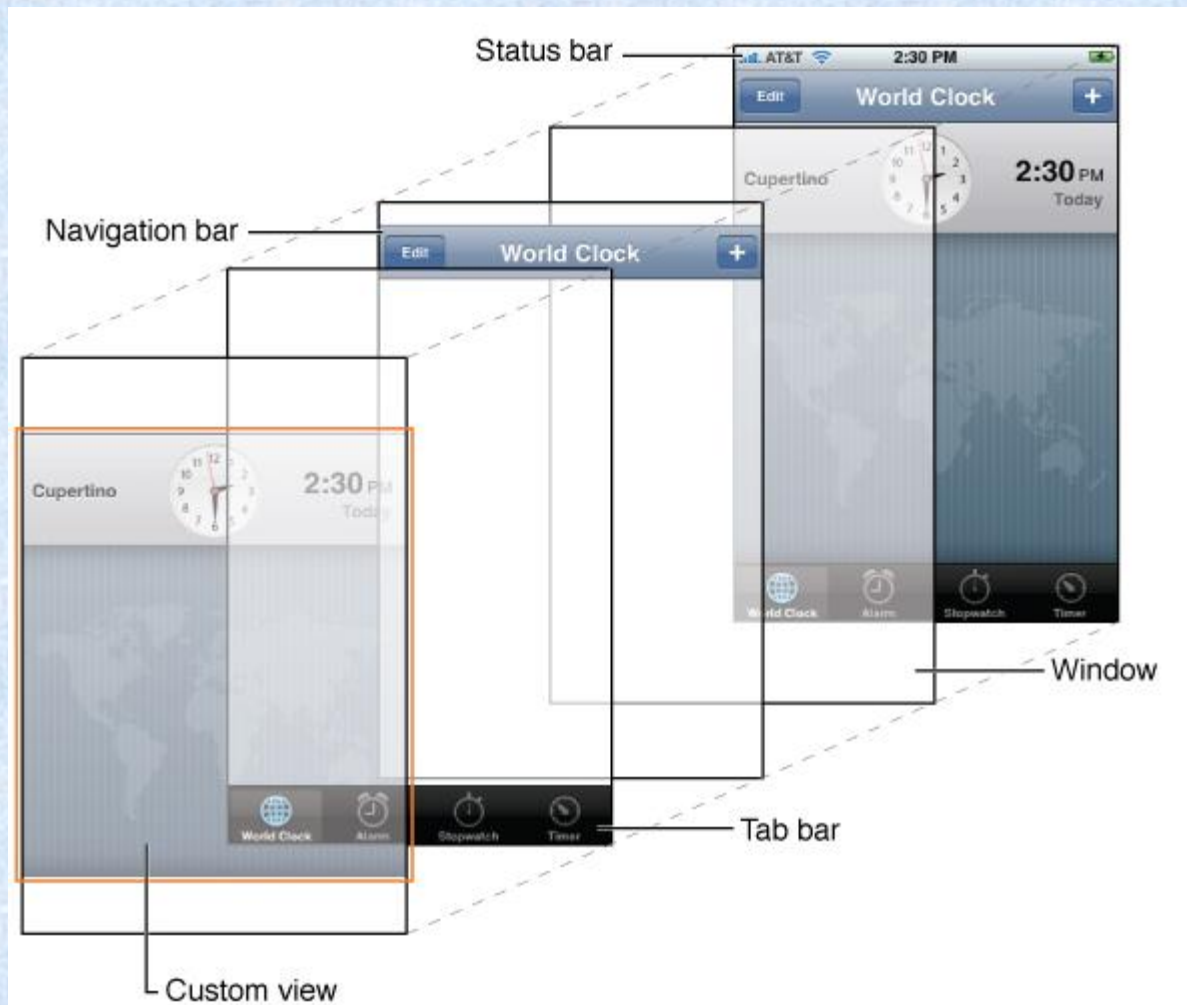

- 获取所有子视图可通过属性subviews

(NSArray *) subviews

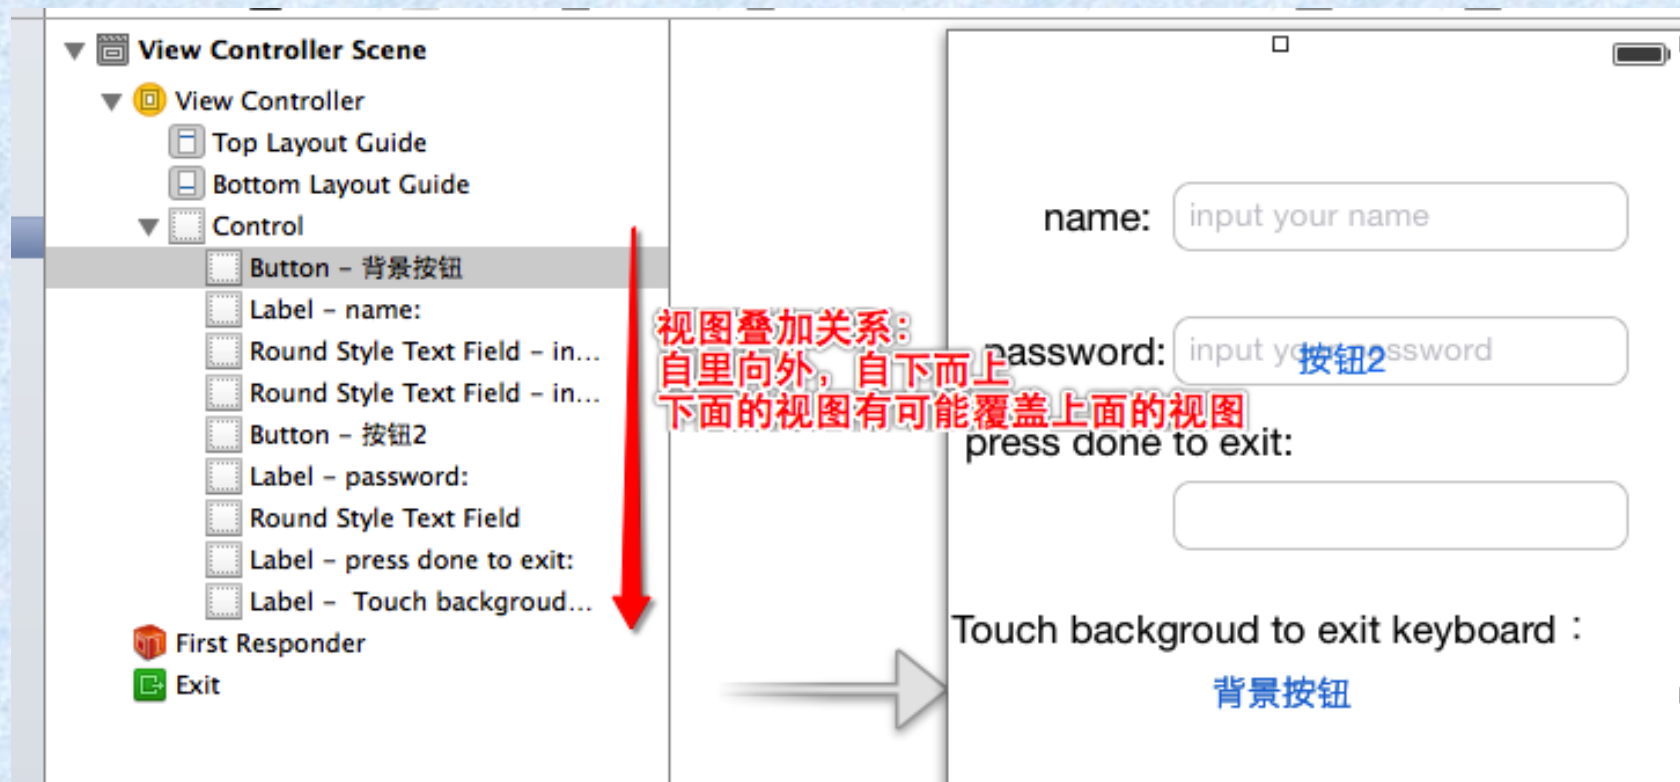

- 可通过tag属性标示一个视图对象(整数)

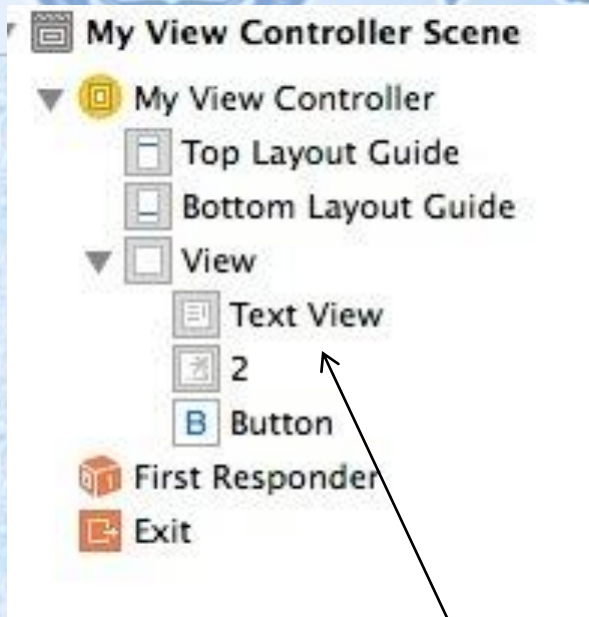

NSInteger tag

在 storyboard 中利用 IB 可以通过拖拽视图来布局，但当视图很多时可能会出现遮挡，此时就需要注意下视图间的层级。所谓层级，就是哪个视图在上，哪个在下，有没有一个视图覆盖其他视图的情况。

Clock程序的视图层

调整方法

- 1: 直接在大纲中拖动设置先后次序
- 2: 在菜单中调整。
- 3: 在代码中调整，调整在subviews中的位置。靠后的在上面。也可以使用 `bringSubviewToFront` 等方法

7、视图的层

在UIView中有一个属性layer,它的类型是CALayer.

layer

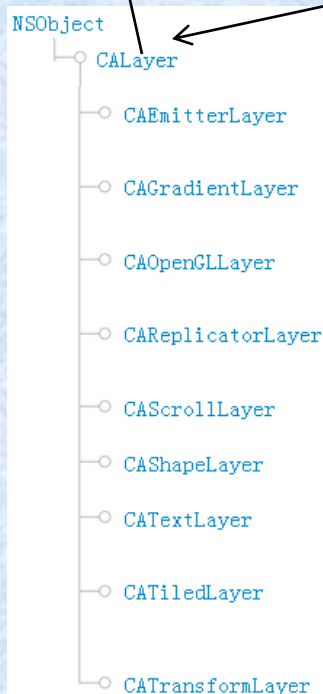

The view's Core Animation layer used for rendering. (read-only)

Declaration

OBJECTIVE-C

@property(n nonatomic, readonly, retain) CALayer *layer

Core Animation
(Quartz Core Framework)

The CALayer class manages image-based content and allows you to perform animations on that content.

The CAEmitterLayer class provides a particle emitter system for Core Animation.

The CAGradientLayer class draws a color gradient over its background color, filling the shape of the layer (including rounded corners) .

CAOpenGLLayer provides a layer suitable for rendering OpenGL content.

The CAReplicatorLayer class creates a specified number of copies of its sublayers (the source layer), each copy potentially having geometric, temporal and color transformations applied to it.

The CAScrollLayer class is a subclass of CALayer that simplifies displaying a portion of a layer.

The CAShapeLayer class draws a cubic Bezier spline in its coordinate space.

The CATextLayer provides simple text layout and rendering of plain or attributed strings.

CATiledLayer is a subclass of CALayer providing a way to asynchronously provide tiles of the layer's content, potentially cached at multiple levels of detail.

CATransformLayer objects are used to create true 3D layer hierarchies, rather than the flattened hierarchy rendering model used by other CALayer classes.

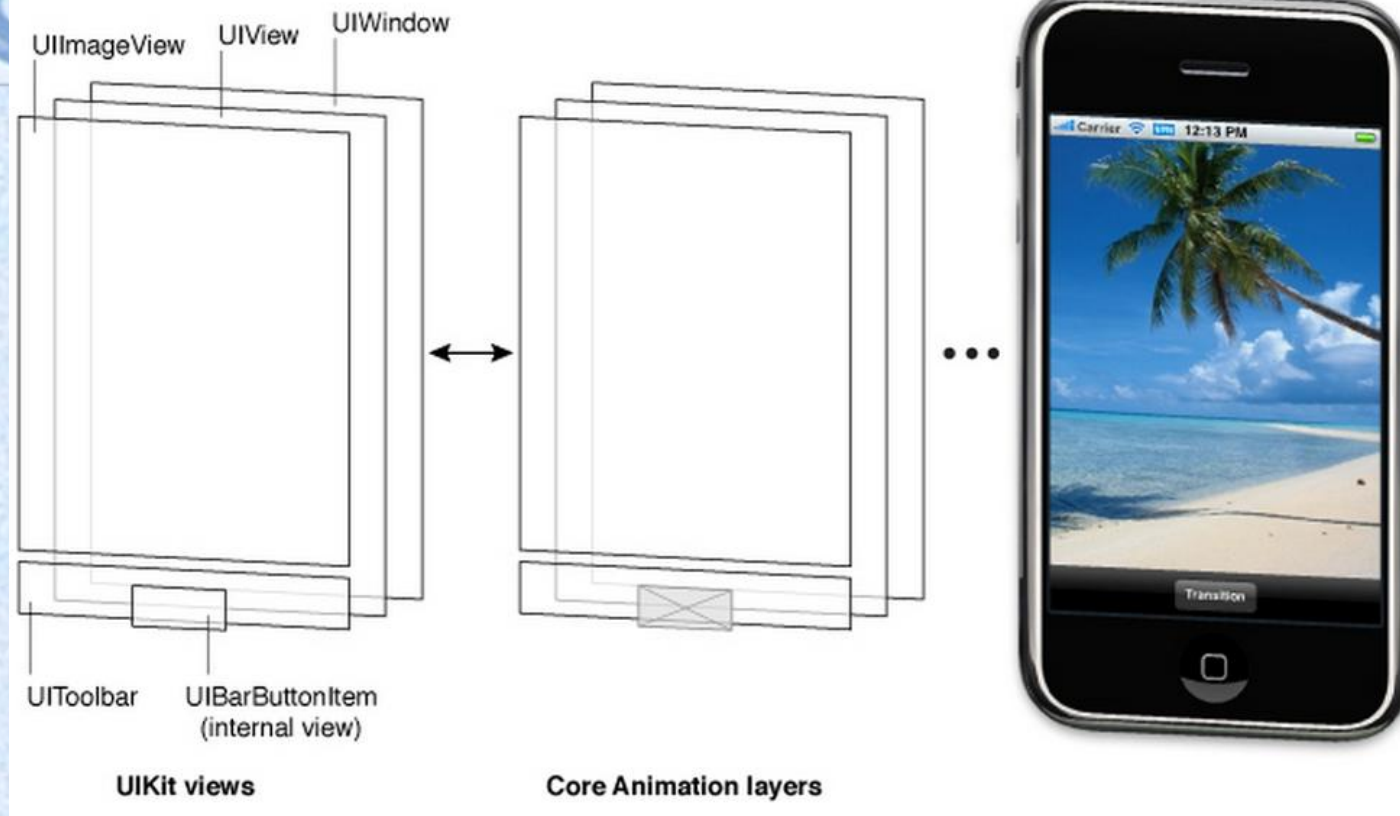

真正的绘图部分

CALayer

The `CALayer` class manages image-based content and allows you to perform animations on that content. Layers are often used to provide the backing store for views but can also be used without a view to display content. A layer's main job is to manage the visual content that you provide but the layer itself has visual attributes that can be set, such as a background color, border, and shadow. In addition to managing visual content, the layer also maintains information about the geometry of its content (such as its position, size, and transform) that is used to present that content onscreen. Modifying the properties of the layer is how you initiate animations on the layer's content or geometry. A layer object encapsulates the duration and pacing of a layer and its animations by adopting the `CAMediaTiming` protocol, which defines the layer's timing information.

If the layer object was created by a view, the view typically assigns itself as the layer's delegate automatically, and you should not change that relationship. For layers you create yourself, you can assign a `delegate` object and use that object to provide the contents of the layer dynamically and perform other tasks. A layer may also have a layout manager object (assigned to the `layoutManager` property) to manage the layout of subviews separately.

视图都被一个层对象支持

UIView来自CALayer，高于CALayer，是CALayer高层实现与封装。UIView的所有特性来源于CALayer支持。
CALayer为视图内容的布局、渲染和合成动画提供基础支撑

与视图一样，层也有父层，子层概念。也有frame,bounds，但多了position和anchorPoint属性

● CGPoint position

用来设置CALayer在父层中的位置，以父层的左上角为原点(0, 0)

● CGPoint anchorPoint

称为“定位点”、“锚点”

以自己的左上角为原点(0, 0)，它的x、y取值范围都是0~1，默认值为(0.5, 0.5).

锚点的选择

例子

```
-(void)viewWillAppear:(BOOL)animated  
{  
    [self.btn2.layer setMasksToBounds:YES];  
    [self.btn2.layer setCornerRadius:12];  
    [self.btn2.layer setBorderWidth:1];  
}
```

8、视图的创建、添加和移除

方法一：在故事板Storyboard中利用IB。
(注意要为IB创建的视图设置对应的类)

方法二：代码方式

- (void)addSubview:(UIView *)view

添加一个子视图，并在最上面显示出来。

初始化返回一个新的拥有特定帧矩形的视图对象

- (id)initWithFrame:(CGRect)aRect

从父视图或者窗口移除，并在响应链中移除。

- (void)removeFromSuperview

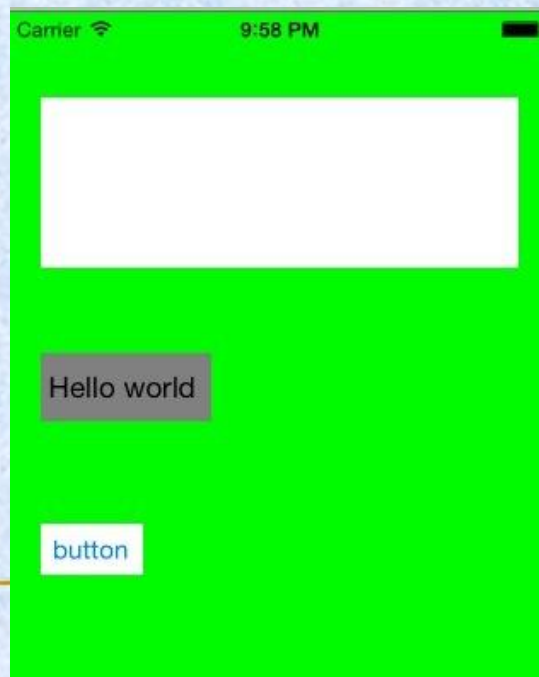

```
UIView *uv1=[[UIView alloc] initWithFrame:CGRectMake(20, 50, 280, 100)];
uv1.backgroundColor=[UIColor whiteColor];

UILabel *l1=[[UILabel alloc] initWithFrame:CGRectMake(20, 200, 100, 40)];
l1.text=@" Hello world";
l1.backgroundColor=[UIColor grayColor];

UIButton *b1=[UIButton buttonWithType:UIButtonTypeRoundedRect];
[b1 setTitle:@"button" forState:UIControlStateNormal];
[b1 setBackgroundColor:[UIColor whiteColor]];
b1.frame=CGRectMake(20, 300, 60, 30);

[self.view addSubview:b1];
[self.view addSubview:l1];
[self.view addSubview:uv1];
```

常用初始化代码:

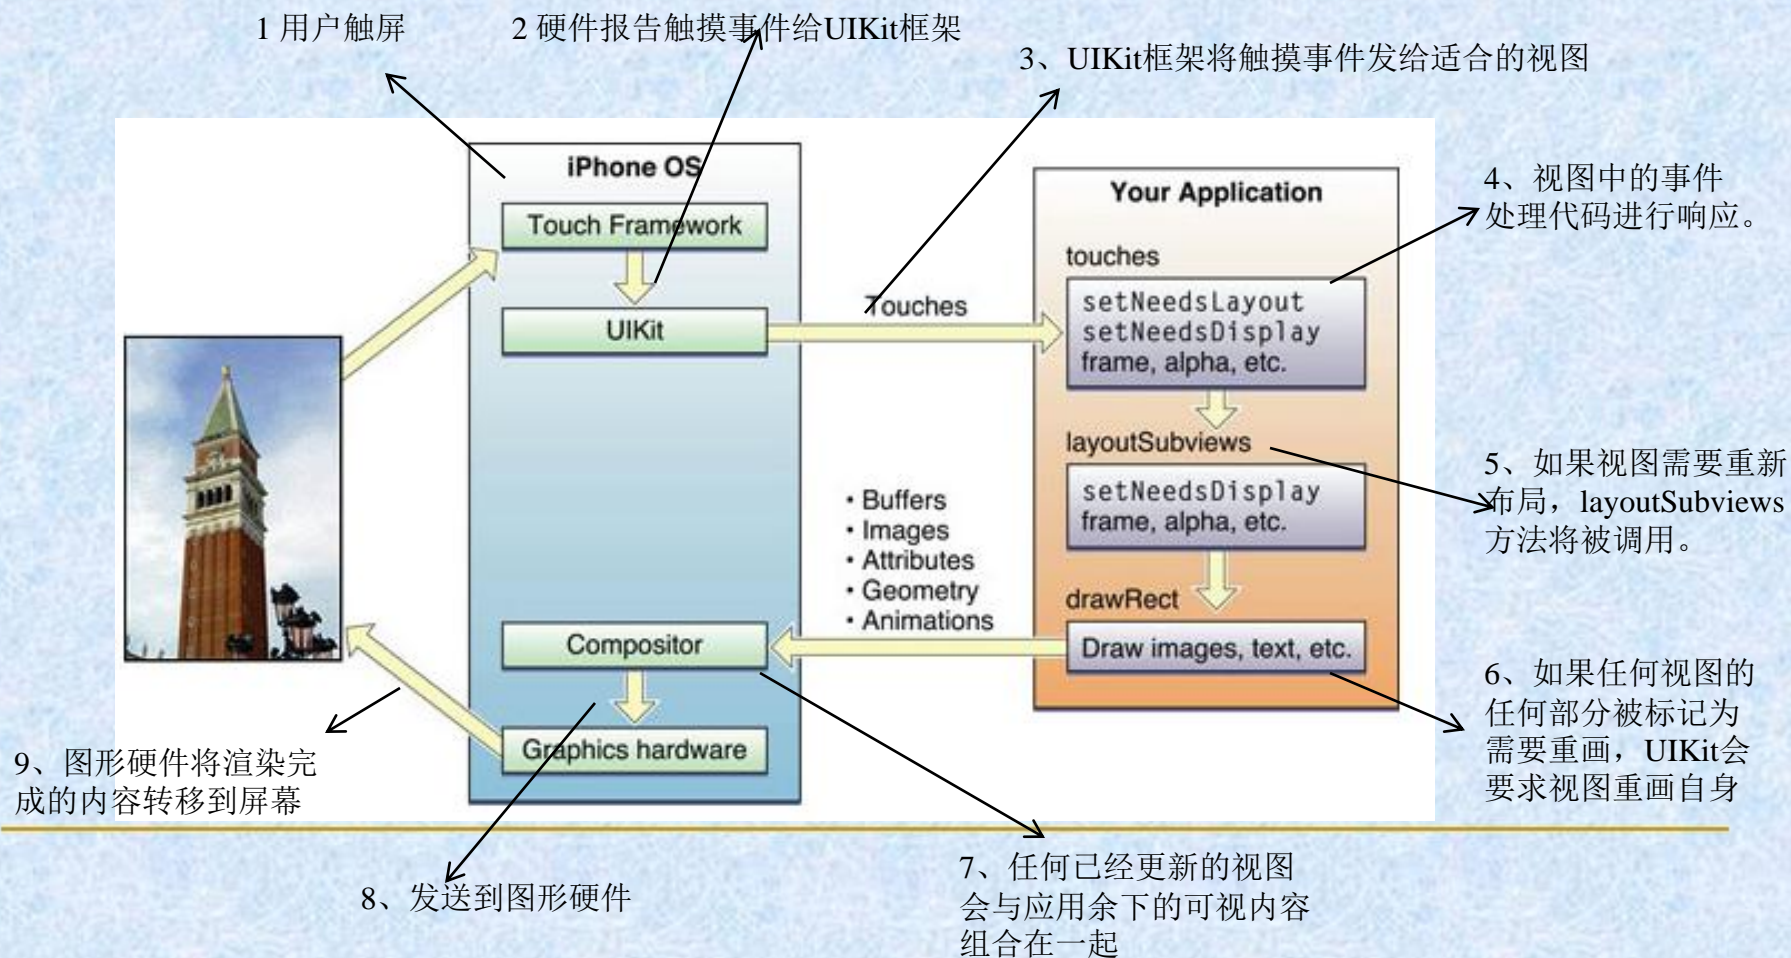

```
- (void)setup { ... }  
-(void)awakeFromNib  
{  
    [self setup];  
}  
- (id)initWithFrame:(CGRect)aRect  
{  
    self = [super initWithFrame:aRect];  
    [self setup];  
    return self;  
}
```

→ 适用于在故事板上使用Interface Builder创建时

9、视图的交互

当进行交互时或以编程方式进行某些修改时，UIKit内部都会产生一系列复杂的事件。

几点注意：

- 可以覆盖drawRect方法，但绝不允许直接发送消息至视图的drawRect方法。
 - 如果需要重绘视图可以直接发送消息至视图的setNeedsDisplay或setNeedsDisplayInRect方法来间接触发drawRect方法重绘视图。
 - setNeedsDisplay和setNeedsDisplayInRect方法异步的。
 - layoutSubviews方法可以覆盖也可以直接发消息。当需要重新布局视图元素时候会使用到该方法
-

layoutSubviews在以下情况下会被调用：

- 用initWithFrame 进行初始化且rect的值不为CGRectZero时会触发
- addSubview会触发layoutSubviews
- 设置view的Frame(frame的值发生变化)会触发layoutSubviews
- 滚动一个UIScrollView会触发layoutSubviews
- 旋转Screen会触发父UIView上的layoutSubviews事件
- 改变一个UIView大小的时候也会触发父UIView上的layoutSubviews事件
- 直接发消息至视图的setLayoutSubviews。

注意：一般不直接发消息至视图的setLayoutSubviews。如果需要重写布局视图元素可使用下面方法。

-(void)layoutIfNeeded

标记为需要重新布局，异步调用layoutIfNeeded刷新布局，不立即刷新，但layoutSubviews一定会被调用

-(void)setNeedsLayout

如果，有需要刷新的标记，立即调用layoutSubviews进行布局（如果没有标记，不会调用layoutSubviews）

说明：如果要立即刷新，需先调用[view setNeedsLayout]，把标记设为需要布局，然后马上调用[view layoutIfNeeded]，实现布局

未覆盖drawRect方法前

```
- (void)drawRect:(CGRect)rect {  
    UIBezierPath *path=[[UIBezierPath alloc] init];  
    [path moveToPoint:CGPointMake(180, 200)];  
    [path addLineToPoint:CGPointMake(240, 350)];  
    [path addLineToPoint:CGPointMake(120, 350)];  
    [path closePath];  
    [[UIColor redColor] setFill];  
    [[UIColor blueColor] setStroke];  
    [path fill];  
    [path stroke];  
  
    // Drawing code  
}
```

```

-(UIColor *)color
{
    if (!_color) {
        _color=[UIColor blueColor];
    }
    return _color;
}

- (void)drawRect:(CGRect)rect {
    UIBezierPath *path=[[UIBezierPath alloc] init];
    [path moveToPoint:CGPointMake(180, 200)];
    [path addLineToPoint:CGPointMake(240, 350)];
    [path addLineToPoint:CGPointMake(120, 350)];
    [path closePath];
    [self.color setFill];
    [self.color setStroke];
    [path fill];
    [path stroke];
}

```

```

- (IBAction)btn1:(UIButton *)sender
{
    if (sender.tag==0)
    {
        UIColor *mycolor=[UIColor redColor];
        self.cgview.color=mycolor;
    }else{
        UIColor *mycolor=[UIColor yellowColor];
        self.cgview.color=mycolor;
    }
}

```

无变化

```
- (IBAction)btn1:(UIButton *)sender
{
    if (sender.tag==0)
    {
        UIColor *mycolor=[UIColor redColor];
        self.cgview.color=mycolor;
        [self.cgview setNeedsDisplay];
    }else{
        UIColor *mycolor=[UIColor yellowColor];
        self.cgview.color=mycolor;
        [self.cgview setNeedsDisplay];
    }
}
```

异步

```
- (IBAction)btn1:(UIButton *)sender
{
    if (sender.tag==0)
    {
        UIColor *mycolor=[UIColor redColor];
        self.cgview.color=mycolor;
        [self.cgview performSelectorOnMainThread:@selector(setNeedsDisplay)
                                     withObject:nil waitUntilDone:NO];
    }else{
        UIColor *mycolor=[UIColor yellowColor];
        self.cgview.color=mycolor;
        [self.cgview performSelectorOnMainThread:@selector(setNeedsDisplay)
                                     withObject:nil waitUntilDone:NO];
    }
}
```

同步

10、视图的自动调整

当改变视图的边框矩形时，其内嵌子视图的位置和尺寸往往也需要改变，以适应原始视图的新尺寸。如果`autoresizesSubviews`属性被设置为YES，则其子视图会根据`autoresizingMask`属性的值自动进行尺寸调整。

简单配置一下视图的自动尺寸调整掩码常常就能使应用程序得到合适的行为；否则必须通过覆盖`layoutSubviews`方法来提供自己的实现。

自动尺寸调整掩码常量

自动尺寸调整掩码

描述

UIViewAutoresizingNone	这个常量如果被设置，视图将不进行自动尺寸调整。
UIViewAutoresizingFlexibleHeight	这个常量如果被设置，视图的高度将和父视图的高度一起成比例变化。否则，视图的高度将保持不变。
UIViewAutoresizingFlexibleWidth	这个常量如果被设置，视图的宽度将和父视图的宽度一起成比例变化。否则，视图的宽度将保持不变。
UIViewAutoresizingFlexibleLeftMargin	这个常量如果被设置，视图的左边界将随着父视图宽度的变化而按比例进行调整。否则，视图和其父视图的左边界的相对位置将保持不变。
UIViewAutoresizingFlexibleRightMargin	这个常量如果被设置，视图的右边界将随着父视图宽度的变化而按比例进行调整。否则，视图和其父视图的右边界的相对位置将保持不变。
UIViewAutoresizingFlexibleBottomMargin	这个常量如果被设置，视图的底边界将随着父视图高度的变化而按比例进行调整。否则，视图和其父视图的底边界的相对位置将保持不变。
UIViewAutoresizingFlexibleTopMargin	这个常量如果被设置，视图的上边界将随着父视图高度的变化而按比例进行调整。否则，视图和其父视图的上边界的相对位置将保持不变。

```
UIButton *btn1 = [UIButton buttonWithType:UIButtonTypeRoundedRect];
btn1.frame = CGRectMake(uv1.frame.size.width-170, 40, 70, 30);
btn1.autoresizingMask = UIViewAutoresizingFlexibleLeftMargin |
    UIViewAutoresizingFlexibleBottomMargin | UIViewAutoresizingFlexibleWidth |
    UIViewAutoresizingFlexibleHeight;
[btn1 setTitle:@"button1" forState:UIControlStateNormal];
[uv1 addSubview:btn1];
```

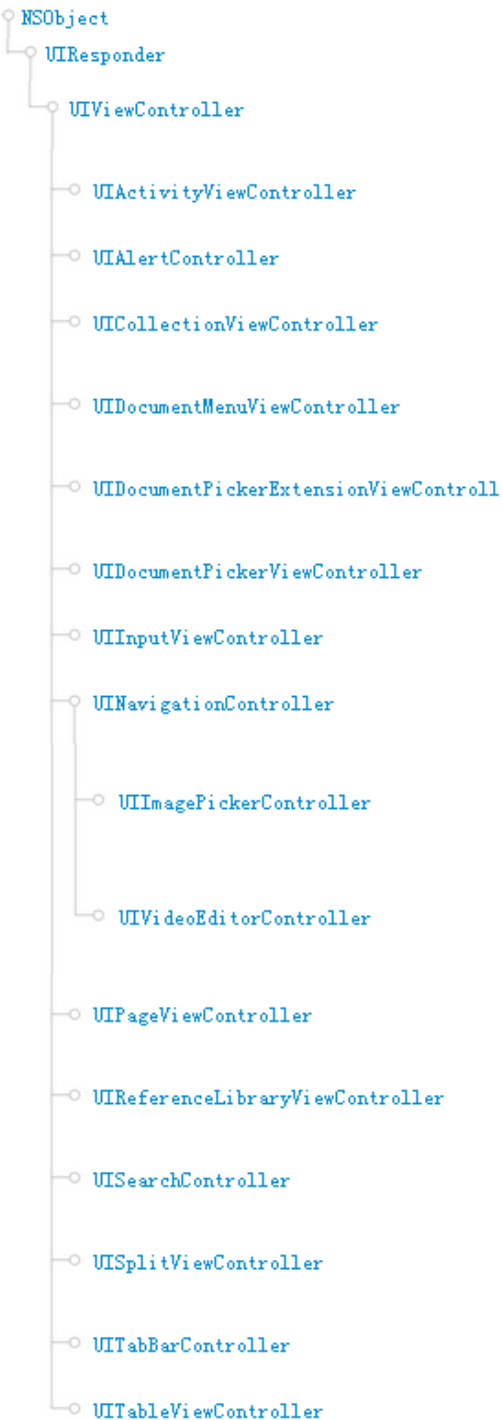

五、视图控制器

1、视图控制器的作用

- 创建和管理视图。
- 管理视图上显示的数据。
- 设备方向变化，调整视图大小以适应屏幕。
- 负责视图和模型之间的数据及请示的传递。

在IOS中，视图控制器对应的类是 `UIViewController`。它是视图和数据间的桥梁。

2、视图控制器的创建和初始化

- 方法一：利用代码生成

```
- initWithNibName:bundle:
```

Returns a newly initialized view controller with the nib file in the specified bundle.

Declaration

OBJECTIVE-C

```
- (instancetype) initWithNibName: (NSString *) nibName  
                      bundle: (NSBundle *) nibBundle
```

Xcode5后不推荐使用initWithNibName方法实例化

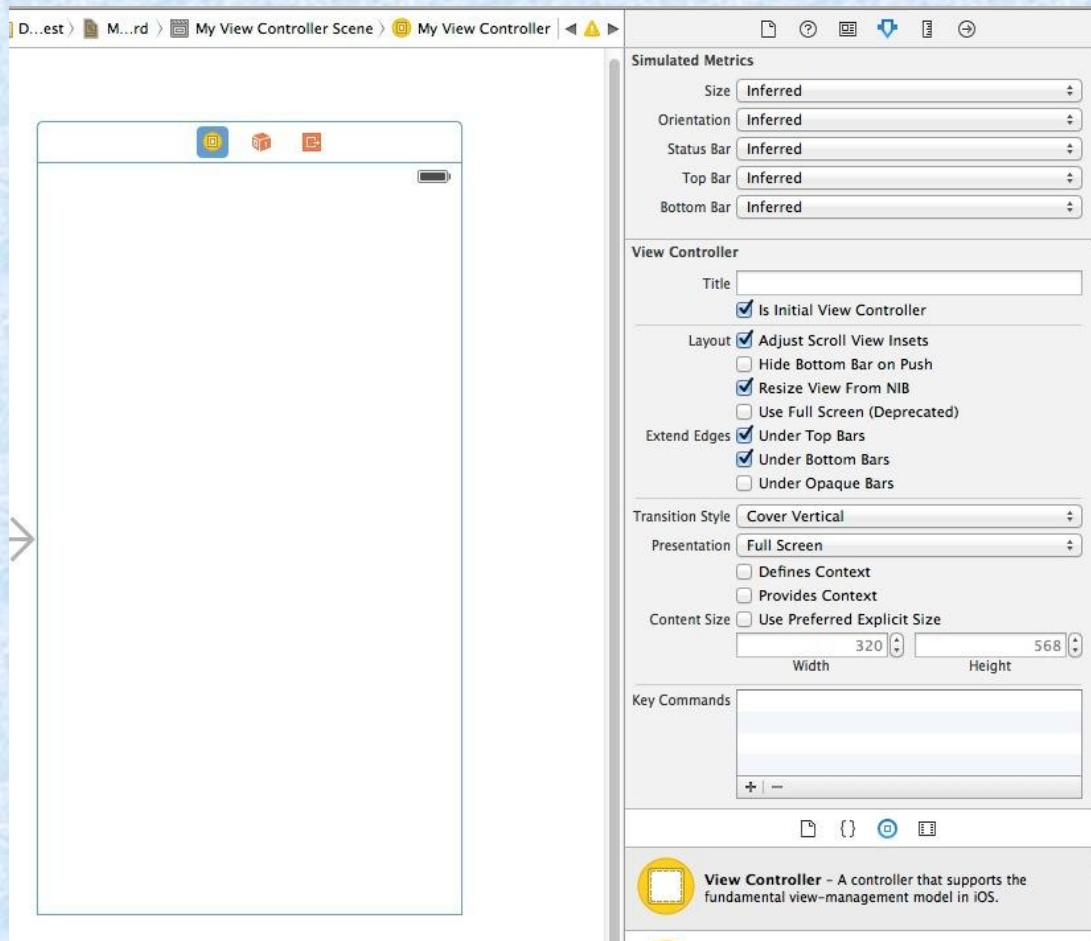

可以覆盖initWithNibName方法，添加自己的初始化代码。

```
-(id)initWithNibName:(NSString *)nibNameOrNil bundle:(NSBundle *)nibBundleOrNil  
{  
    self = [super initWithNibName:nibNameOrNil bundle:nibBundleOrNil];  
    if (self) {  
        UILabel *label=[[UILabel alloc] initWithFrame: CGRectMake(0,0,160,160)];  
        [self.view addSubview: label];  
    }  
    return self;  
}
```

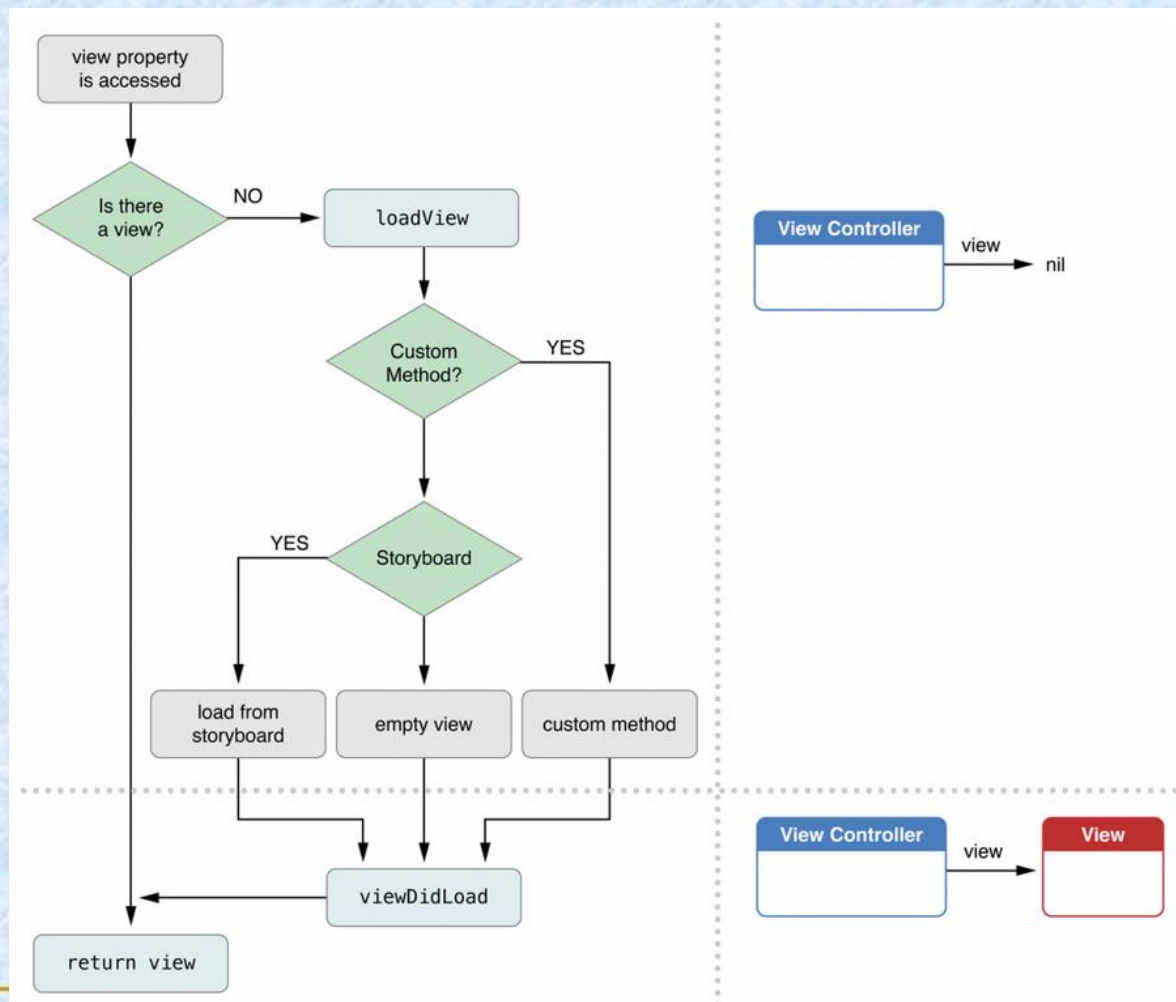

- 方法二：在Storyboard利用IB创建

推荐使用Storyboard进行创建

2、视图控制器的生命周期

- loadView

当由视图控制器管理的视图为nil时触发。

- loadView

Creates the view that the controller manages.

Declaration

OBJECTIVE-C

- (void)loadView

Discussion

You should never call this method directly. The view controller calls this method when its `view` property is requested but is currently `nil`. This method loads or creates a view and assigns it to the `view` property.

当视图控制器由Storyboard创建时，无需考虑。
此方法可用于以代码的方式创建视图时用到。

- viewDidLoad

在由Storyboard实例化,后且所有的outlet设置完成后触发。

- viewDidLoad

Called after the controller's view is loaded into memory.

Declaration

OBJECTIVE-C

- (void)viewDidLoad

Discussion

This method is called after the view controller has loaded its view hierarchy into memory. This method is called regardless of whether the view hierarchy was loaded from a nib file or created programmatically in the `loadView` method. You usually override this method to perform additional initialization on views that were loaded from nib files.

注意：

- 如果视图控制器是由代码方式创建，也会触发该方法
- 不要修改视图几何信息

- viewWillAppear

在视图显示在屏幕前触发。

- viewWillAppear:

Notifies the view controller that its view is about to be added to a view hierarchy.

Declaration

OBJECTIVE-C

- (void)viewWillAppear:(BOOL)animated

Parameters

<i>animated</i>	If YES, the view is being added to the window using an animation.
-----------------	---

Discussion

This method is called before the receiver's view is about to be added to a view hierarchy and before any animations are configured for showing the view. You can override this method to perform custom tasks associated with displaying the view. For example, you might use this method to change the orientation or style of the status bar to coordinate with the orientation or style of the view being presented. If you override this method, you must call `super` at some point in your implementation.

比较viewWillAppear和viewDidLoad

- viewDidAppear

在视图在屏幕上显示后触发。

- viewDidAppear:

Notifies the view controller that its view was added to a view hierarchy.

Declaration

OBJECTIVE-C

- (void)viewDidAppear: (BOOL) animated

Parameters

<i>animated</i>	If YES, the view was added to the window using an animation.
-----------------	--

Discussion

You can override this method to perform additional tasks associated with presenting the view. If you override this method, you must call `super` at some point in your implementation.

- viewWillDisappear

在视图离开屏幕前触发。

– viewWillDisappear:

Notifies the view controller that its view is about to be removed from a view hierarchy.

Declaration

OBJECTIVE-C

– (void)viewWillDisappear: (BOOL) *animated*

Parameters

<i>animated</i>	If YES, the disappearance of the view is being animated.
-----------------	--

Discussion

This method is called in response to a view being removed from a view hierarchy. This method is called before the view is actually removed and before any animations are configured.

- `viewDidDisappear`
在视图离开屏幕后触发。

– `viewDidDisappear:`

Notifies the view controller that its view was removed from a view hierarchy.

Declaration

OBJECTIVE-C

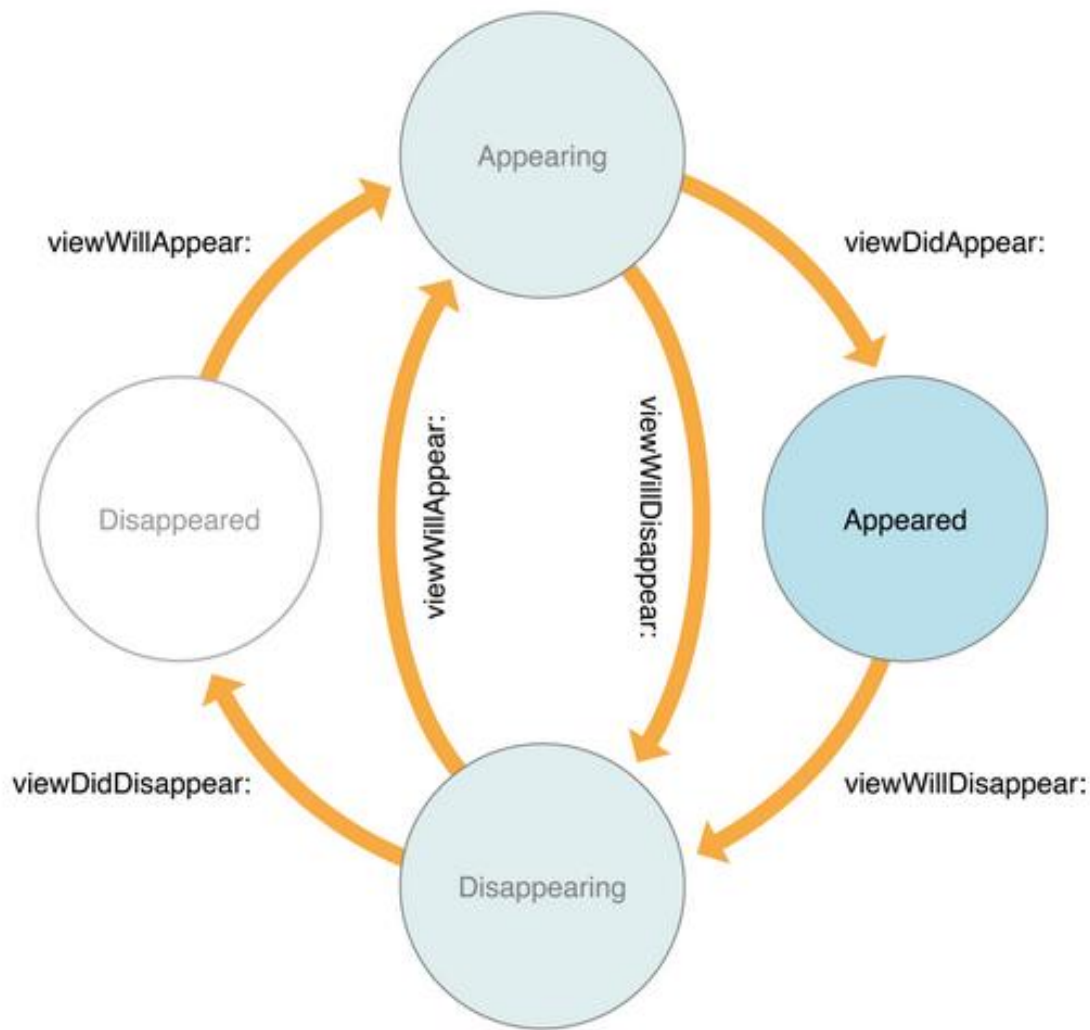

– `(void)viewDidDisappear:(BOOL)animated`

Parameters

<i>animated</i>	If YES, the disappearance of the view was animated.
-----------------	---

Discussion

You can override this method to perform additional tasks associated with dismissing or hiding the view. If you override this method, you must call `super` at some point in your implementation.

其它一些常用方法

自动布局:

- - (void)viewWillLayoutSubviews
- - (void)viewDidLayoutSubviews

旋转相关

- - (void) willRotateToInterfaceOrientation: (UIInterfaceOrientation) anOrientation
duration:(NSTimeInterval) seconds
 - - (void) willAnimateRotationToInterfaceOrientation: (UIInterfaceOrientation) orient
duration:(NSTimeInterval)seconds
 - - (void) didRotateFromInterfaceOrientation:(UIInterfaceOrientation)anOrientation
 - - (BOOL) shouldAutorotate
 - - (NSUInteger) supportedInterfaceOrientations
-

willRotateToInterfaceOrientation:duration:

rotate the view

viewWillLayoutSubviews

willAnimateRotationToInterfaceOrientation:duration:

rotation is complete

didRotateFromInterfaceOrientation:

设备方向

```
typedef NS_ENUM(NSInteger, UIDeviceOrientation) {  
    UIDeviceOrientationUnknown,  
    UIDeviceOrientationPortrait,           // Device oriented vertically, home button on the bottom  
    UIDeviceOrientationPortraitUpsideDown, // Device oriented vertically, home button on the top  
    UIDeviceOrientationLandscapeLeft,      // Device oriented horizontally, home button on the right  
    UIDeviceOrientationLandscapeRight,     // Device oriented horizontally, home button on the left  
    UIDeviceOrientationFaceUp,             // Device oriented flat, face up  
    UIDeviceOrientationFaceDown            // Device oriented flat, face down  
};
```

界面方向

```
typedef NS_ENUM(NSInteger, UIInterfaceOrientation) {  
    UIInterfaceOrientationPortrait          = UIDeviceOrientationPortrait,  
    UIInterfaceOrientationPortraitUpsideDown = UIDeviceOrientationPortraitUpsideDown,  
    UIInterfaceOrientationLandscapeLeft    = UIDeviceOrientationLandscapeRight,  
    UIInterfaceOrientationLandscapeRight   = UIDeviceOrientationLandscapeLeft  
};
```

• didReceiveMemoryWarningWarning

- didReceiveMemoryWarningWarning

Sent to the view controller when the app receives a memory warning.

Declaration

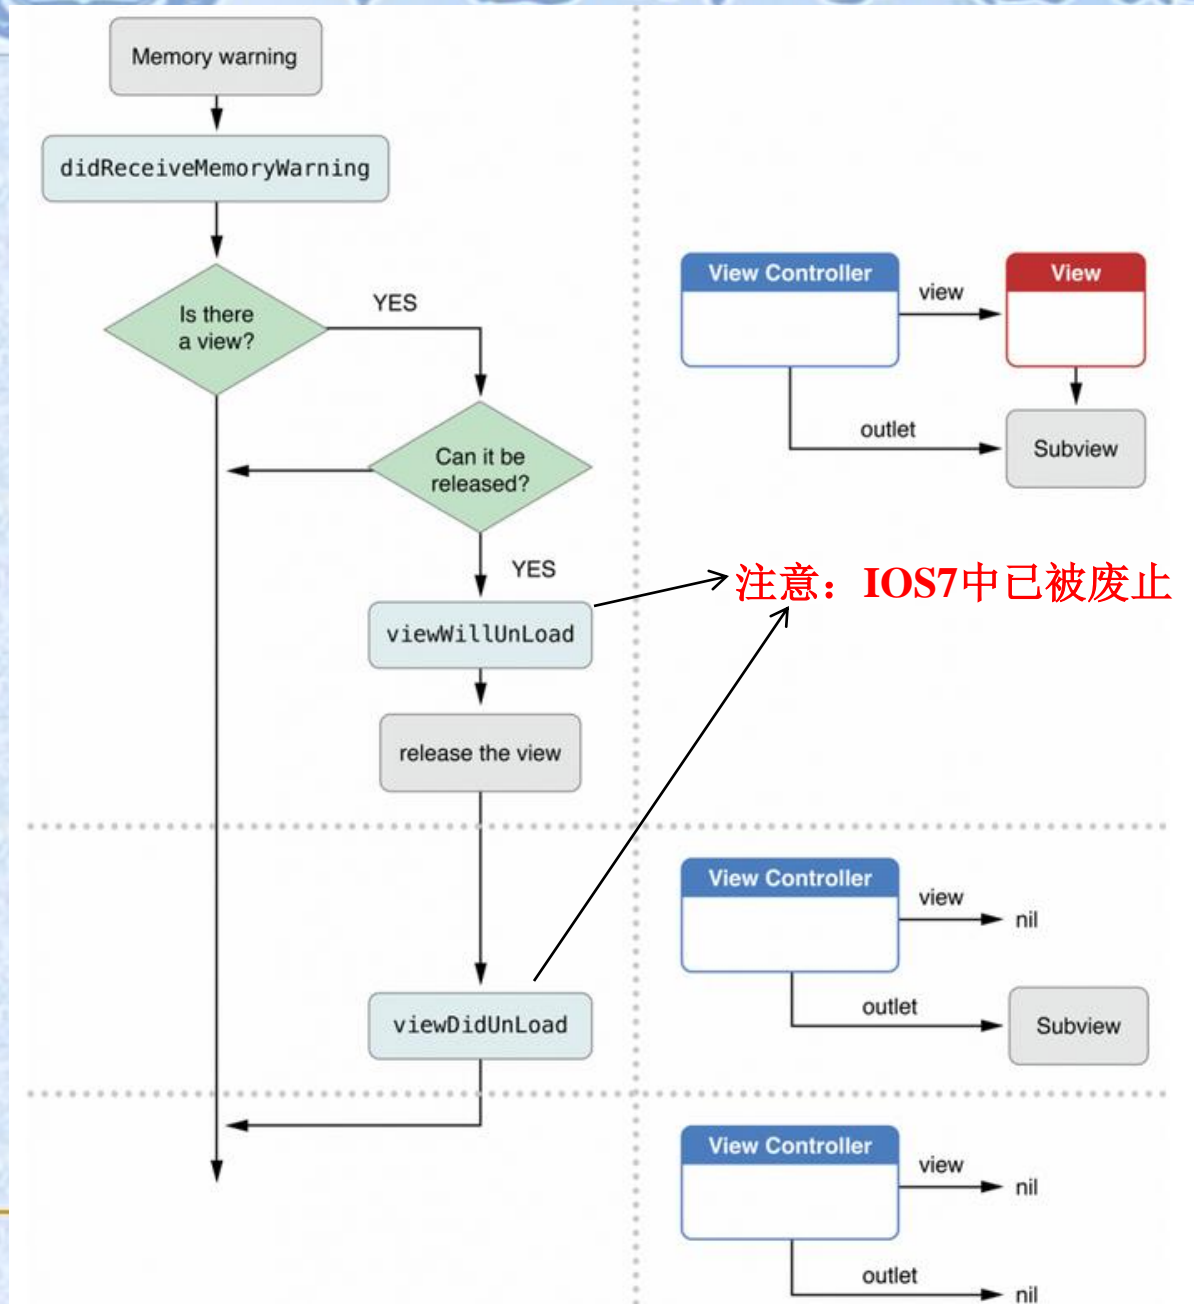

OBJECTIVE-C

```
- (void)didReceiveMemoryWarning
```

Discussion

Your app never calls this method directly. Instead, this method is called when the system determines that the amount of available memory is low.

You can override this method to release any additional memory used by your view controller. If you do, your implementation of this method must call the `super` implementation at some point.

• awakeFromNib

当.nib文件或IB archive 被加载的时，会发送一个awakeFromNib的消息到对象，每个对象都可以定义自己的 awakeFromNib函数来响应这个消息，执行一些必要的操作。

- awakeFromNib

Prepares the receiver for service after it has been loaded from an Interface Builder archive, or nib file.

Declaration

OBJECTIVE-C

- (void)awakeFromNib

Discussion

The nib-loading infrastructure sends an `awakeFromNib` message to each object recreated from a nib archive, but only after all the objects in the archive have been loaded and initialized. When an object receives an `awakeFromNib` message, it is guaranteed to have all its outlet and action connections already established.

• initWithCoder

当视图从.nib文件或IB archive 会加载对象实例时，使用 initWithCoder初始化这些实例对象。

- initWithCoder:

Returns an object initialized from data in a given unarchiver. (required)

Declaration

OBJECTIVE-C

- (id) initWithCoder: (NSCoder *) *decoder*

Parameters

<i>decoder</i>	An unarchiver object.
----------------	-----------------------

Return Value

self, initialized using the data in *decoder*.

Discussion

You must return *self* from `initWithCoder:`. If you have an advanced need that requires substituting a different object after decoding, you can do so in `awakeAfterUsingCoder:`.

六、Outlet和Action

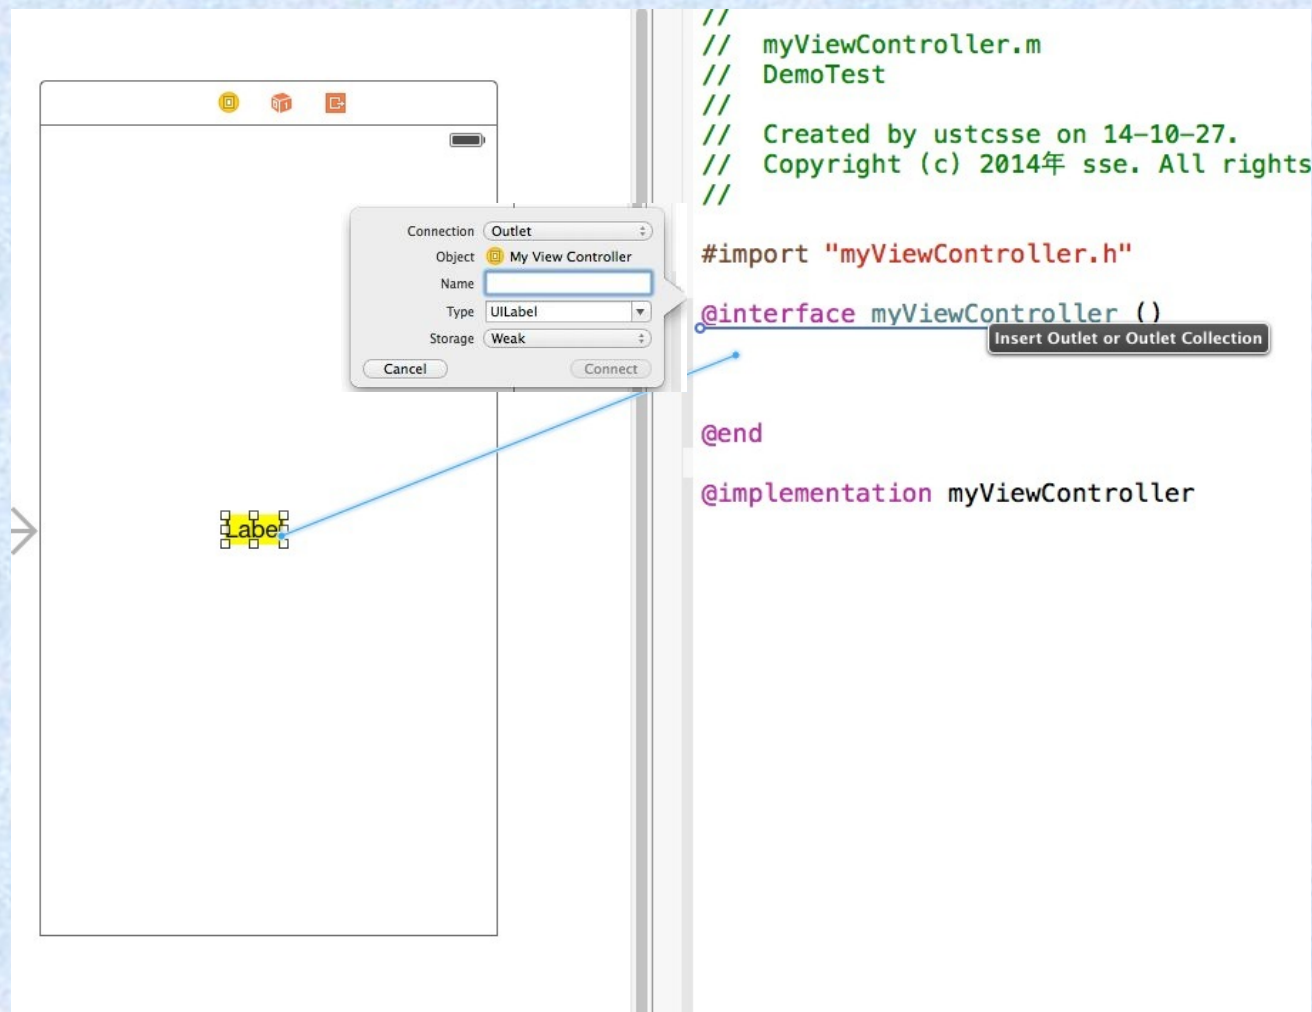

当在Storyboard中使用Interface Builder以图形化的方式建立用户界面后，必须设置Outlet和Action，将Interface Builder中放置的控件与代码之间建立连接。

使用Outlet，以定义变量的方式将控件链接到代码，该变量代表控件。

使用Action，以定义方法的方式将控件链接到代码，该方法在用户与控件进行交互时运行。

设置方法

Ctrl + drag

```
// myViewController.m
// DemoTest
//
// Created by ustcsse on 14-10-27.
// Copyright (c) 2014年 sse. All rights reserved.
//

#import "myViewController.h"

@interface myViewController ()
@property (weak, nonatomic) IBOutlet UILabel *label1;

@end

@implementation myViewController
```

The screenshot shows the Xcode interface. On the left is the Interface Builder canvas with a yellow label 'Lab' and a blue button. A connection dialog box is open, showing 'Connection' set to 'Action', 'Object' as 'My View Controller', 'Name' as an empty field, 'Type' as 'id', 'Event' as 'Touch Up Inside', and 'Arguments' as 'Sender'. An arrow points from the 'Connect' button in the dialog to the code on the right. The code is as follows:

```
// Created by ustcsse on 14-10-27.  
// Copyright (c) 2014年 sse. All rights reserved.  
//  
#import "myViewController.h"  
  
@interface myViewController ()  
@property (weak, nonatomic) IBOutlet UILabel *label1;  
  
@end  
  
@implementation myViewController
```

Ctrl + drag

The image shows a screenshot of the Xcode IDE. On the left, a storyboard is visible with a yellow box labeled "Label" and a blue button labeled "Button". An arrow points from the "Button" to the implementation of the `btn1:` method in the `myViewController.m` file on the right.

```
// DemoTest
//
// Created by ustcsse on 14-10-27.
// Copyright (c) 2014年 sse. All rights reserved.
//

#import "myViewController.h"

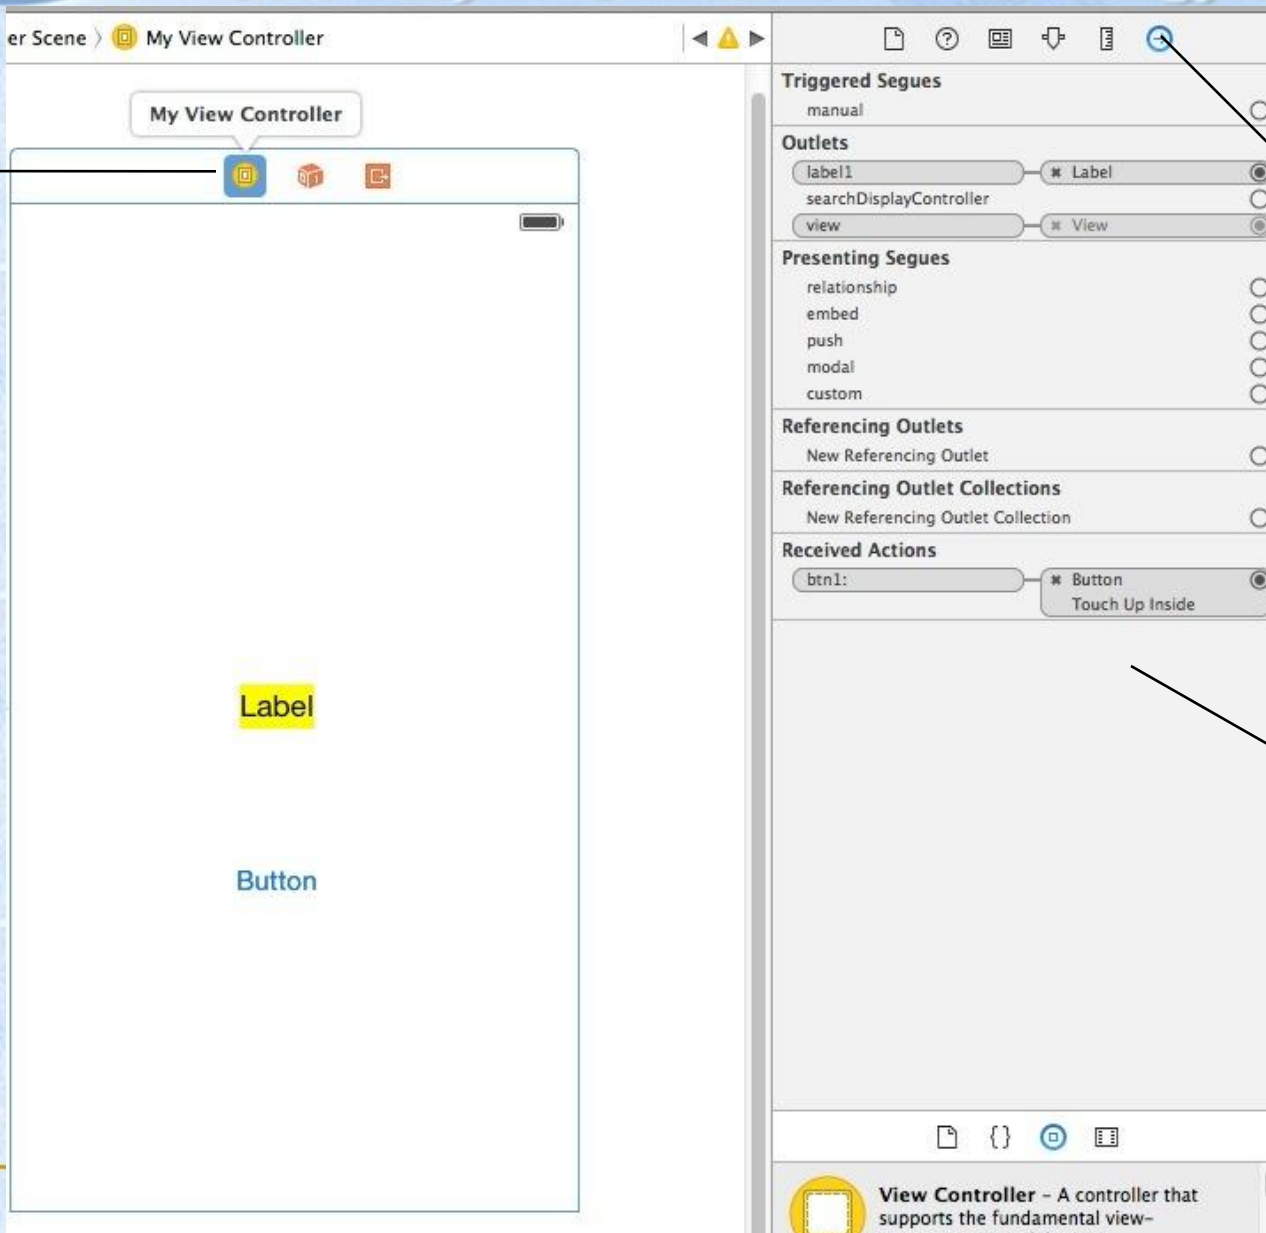

@interface myViewController ()
@property (weak, nonatomic) IBOutlet UILabel *label1;

@end

@implementation myViewController

- (IBAction)btn1:(UIButton *)sender
{

}
```

1、选中视图
控制器

接检查器

查看连接情况

代码生成的UIControl类视图如何添加事件？

OBJECTIVE-C

```
- (void)addTarget:(id) target  
        action:(SEL) action  
    forControlEvents:(UIControlEvents) controlEvents
```

```
-(void)viewDidLoad{  
    [super viewDidLoad];  
    UIButton *button = [UIButton buttonWithType:UIButtonTypeRoundedRect];  
    button.backgroundColor=[UIColor whiteColor];  
    // 通过代码添加事件  
    [button addTarget:self action:@selector(touchTown)  
                forControlEvents:UIControlEventTouchUpInside];  
    [button setTitle:@"代码按钮" forState:UIControlStateNormal];  
    button.frame = CGRectMake(100.0, 210.0, 100.0, 50.0);  
    [self.view addSubview:button];  
}  
  
-(void)touchTown{  
    self.view.backgroundColor=[UIColor redColor];  
}
```

七、UIKIT框架中常用的视图
